# Introduction

The main aim of this booklet is to exemplify standards for those teaching Cambridge AS & A Level Psychology 9990, and to show how different levels of candidates' performance (high, middle and low) relate to the subject's curriculum and assessment objectives.

In this booklet candidate responses have been chosen from June 2018 scripts to exemplify a range of answers.

For each question, the response is annotated with a clear explanation of where and why marks were awarded or omitted. This is followed by examiner comments on how the answer could have been improved. In this way, it is possible for you to understand what candidates have done to gain their marks and what they could do to improve their answers. There is also a list of common mistakes candidates made in their answers for each question.

This document provides illustrative examples of candidate work with examiner commentary. These help teachers to assess the standard required to achieve marks beyond the guidance of the mark scheme. Therefore, in some circumstances, such as where exact answers are required, there will not be much comment.

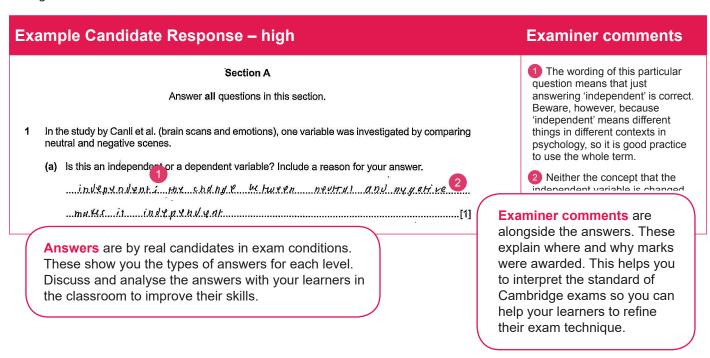

The questions and mark schemes used here are available to download from the School Support Hub. These files are:

June 2018 Question Paper 32
June 2018 Paper 32 Mark Scheme

Past exam resources and other teacher support materials are available on the School Support Hub: www.cambridgeinternational.org/support

#### How to use this booklet

This booklet goes through the paper one question at a time, showing you the high-, middle- and low-level response for each question. The candidate answers are set in a table. In the left-hand column are the candidate answers, and in the right-hand column are the examiner comments.

# How the candidate could have improved their answer

- Although both parts of this answer earned full marks, it would be good practice to get into the habit of always
  specifying 'independent variable', as using just a single word could be insufficient in response to other questions.
  Note that an 'independent measures design' would be another case where a single word answer of 'independent'
  may not be adequate.
- Operationalisation is a concept that often leads to confusion. The simplest way to answer such as question would be to think 'How could I manipulate (or measure) this in practice?', then write a description.

This section explains how the candidate could have improved each answer. This helps you to interpret the standard of Cambridge exams and helps your learners to refine their exam technique.

# Common mistakes candidates made in this question

In part (a) a common mistake was to give the dependent variable in place of the independent variable. The difference between these two variables is simply one of giving them the right names. One way to remember which is which is to think 'What is the researcher **IN**vestigating?' this is their **IN**dependent variable. The **depend**ent variable is exactly what it says, changes in this variable **depend** on, i.e. are caused by, the manipulation of the independent variable.

Often candidates were not awarded marks because they misread or misinterpreted the questions.

Lists the common mistakes candidates made in answering each question. This will help your learners to avoid these mistakes and give them the best chance of achieving the available marks.

# **Question 1**

kample (	Candidate Response – high	Examiner comments
Question Part  1. a)	ECT is a schizophrenia therapy which constitutes of scuding electric shocks to the brain in order to create seizures in the patrent which reduces symptoms of schizophrenia for a short perrod period of time.	1 1 mark for electric shock via the brain in order to create seizure. Basic explanation of the term.  Mark for (a) = 1 out of 2
b)	The Study wed virtual reality: the participant had to wear a headset which placed them in virtual social situations of comments of me virtual reality, passing in front of virtual individuals. The researchers tecorded comments being made at me funny or "minding my and business" when the participant interacted with members in the virtual reality, allowing to assess the text of delivation the participant of Columnians.	<ul> <li>2 Correct details from the procedure of the study is given (headset and riding a subway).</li> <li>3 Correct detail of the procedure of the study is given (recording comments).</li> <li>4 Correct detail of the procedure of the study is given (assess level of delusion).</li> <li>Mark for (b) = 4 out of 4</li> </ul>
(C)	This & proadure was reliable as it allowed was done and undergone in a lab, meaning more standardised equipment and less extraneous variables. As Marcarer, the VR set and "software in which the participant walks can be used are and are again as the situation remains the same. This increases retrability as the experiment can be repeated pumerans time in different condition, reinfercing the reliability of the results.  It answer, the dumand characteristics of the procedure might be very high as the participants can see the purpose of going in a social setting and therefore change their hatural reactions or not communicate their thoughts to the experimenter. Marcarer, the ecological revaluating of the experiment might is very law which might result in tesults being non-representative and thingare procusatent/	5 Correct point about reliability with example from the study and clear reference is made to reliability and why this would improve the reliability of the study. Mark for (c) = 4 out of 6  Total mark awarded = 9 out of 12

- (a) The candidate should have given additional information about electro-convulsive therapy such as the length of the shock or the side of the brain the shock can be sent to (uni- or bi-lateral).
- (c) The second point was related to validity and not reliability. The candidate should have explained that some of the patients might have shown demand characteristics whereas others might not have shown demand characteristics, and this would have had a negative effect on the standardisation of the procedure across all that used the virtual reality.

- 1 Reference has been made to electric impulse that produces a seizure in the brain.
- 2 Mark is awarded for length of seizure and also number of sessions typically given. This is a detailed definition of the term. Mark for (a) = 2 out of 2
- 3 The candidate gives correct detail of the procedure of the study.
- 4 The candidate gives correct detail of the sample which is a part of the procedure of the study.
- 5 Reference has been made to further details (headgear and questionnaire) of the procedure of the study.

Mark for (b) = 3 out of 4

ample Candidate Response – middle, continued	Examiner comments
by practioners to assess the symptoms of schizoprehia and create therapies for the individuals. Study also took self report from the participants after their walk in UK 6 environment which increase the reliability. It has the issue of cultural bias, Hearing voices or seeing things can be normal for one culture but not for the others results connot be generalised. More studies should be conducted in different areas to check the realiability.  Study was conducted in underground from scene in a more realistic environment increasing Validity.	6 There is limited explanation of a feature of the study (self-report) that does have some bearing on the reliability of the study.  Mark for (c) = 1 out of 6  Total mark awarded = 6 out of 12

- (b) The candidate should have extended the final points made about the procedure of the study with more details of the questionnaire given to the participants/patients.
- (c) Most of this response related to the validity of the study. The candidate should have linked some of their points to reliability such as stating that the situation may have seemed real for some of the participants but not to others which would lower the reliability of the procedure as it would not be assessing symptoms of schizophrenia consistently. Issues such as cultural bias and practical applications were not relevant to reliability.

#### Example Candidate Response – low **Examiner comments** Question Part 'Electro-convulsive therapy' is when a small 01 1 Current on for one second is is paned through a patient awarded 1 mark. This is a basic explanation of the term. Mark for (a) = 1 out of 2 6) 2 The candidate identifies some features of the procedure (such as the avatar and 'neutral' situation). No clear details have been given. Mark for (b) = 1 out of 4 3 The candidate gives basic reference to reliability by stating that the environment was 'set' the which implies that the environment in VR and remained constant for each patient/participant. Mark for (c) = 1 out of 6 Total mark awarded = 3 out of 12 different various patients

# How the candidate could have improved their answer

- (a) A basic explanation was given. To improve, the candidate should have mentioned that the electrical current produces a seizure in the patient's brain.
- (b) A basic description of the procedure was given. To improve, specific features of the procedure should have been given such as the underground train, measures of paranoia, details of the actions of the avatars and 200 non-clinical members of the general population.
- (c) The candidate could have improved their response by defining what was meant by reliability and give some examples from the study that might improve or decrease its reliability. Examples could include in what ways the procedure was standardised for all participants (e.g. the same virtual reality environment) and in what ways the procedure might have been inconsistent. For example, some participants may have felt the environment was very fake and did not engage with it while others may have felt it was very realistic. Therefore, the measure would have been experienced in different ways by the participants. Reference could have also been made to the self-reports used in the study being the same for all participants.

# Common mistakes candidates made in this question

- (a) Some responses were brief and simply explained that ECT is an electrical shock that is given into the brain of the patient which induces a seizure. Very few candidates mentioned anything additional such as the length of the shock or that it can be done uni- or bi-laterally.
- (b) Responses were sometimes brief with just a few details of the study such as the virtual reality headset and the virtual reality environment of the subway.
- (c) There was lack of understanding of reliability as the consistency of the measuring device. Many discussed issues around validity rather than reliability such as demand characteristics and ecological validity. These issues could have been related to reliability but very few candidates were able to do this.

# **Question 2**

# Example Candidate Response – high Examiner comments medicine That all know form of control disorder in individual decease Phypulse out to investigate the effect of the propulse contor disorders. Some details of the study have been given with the correct biochemical treatment as well as an indication of the results. he approach that all behaviour occurs response, has two forms control disorders dissider Covert senestization carry out the Impulsive The candidate gives clear details of covert sensitisation treatment. even though relaxants & techniques allow with used to pair the 4. 35 her disorder and she found it much easier to 3 Details of the study have been given with some indication of how the treatment was done and the effect on the woman at the end of is another procedure which the study. techniques first, and then make the by wing through and the was retesteing into his

# Example Candidate Response – high, continued **Examiner comments** Question 4 The candidate gives details of and helped improve his relationship sprobel may to imaginal desensitisation. treat such disorder is Impuly feeling state The first place 5 The candidate gives brief details of impulse control therapy and cognitive behavioural therapy. Mark for (a) = 7 out of 8 6 The candidate gives accurate evaluation of opiate treatment. A · · · · addictive disorder. brief comment is made about the representativeness of the sample and the effect of the control group on validity. study may technique. The technique was control disorder partients will react the Many evaluation points are raised regarding covert sensitisation and each one is lone selfalolyty as accurate. There is some use of appropriate terminology but these

are brief with no analysis.

# Example Candidate Response – high, continued **Examiner comments** Question Part dissentingization may also caused out or prodividual, who and boused to treate the disorder only, which limity generalisate This dechnique 8 Reference has been made to named issue in the question. 9 A number of evaluation points have been made about imagery introduce goval desira desensitisation. Each is brief but accurate with some appropriate terminology used. 10 Accurate evaluation point desirability by as from the regarding impulse control therapy. in everyday 11) The candidate makes references to the named issue in the question and makes points regarding a number of different treatments and the application of these treatments to everyday life. Mark for (b) = 6 out of 10 Total mark awarded = 13 out of 18

- (a) The candidate should have selected fewer treatments and done one or two in more depth. For example, more information could have been given at the start on the Grant et al. study with details of the procedure, sample and specific findings.
- (b) The candidate should have restructured their response and discussed three or four issues rather than evaluating each treatment in turn. The answer should have been started with the named issue of application to everyday life and evaluated two or three of the treatments described in part (a). The candidate also needed to provide some analysis. This could have been done by considering the counter-argument for the issue they had raised. For example if the candidate had argued the treatment had good applications to everyday life, they could also state why it might have been difficult to apply to everyday life or they could discuss the issues the psychologists could have with trying to achieve practical applications (e.g. the research could be very realistic and could therefore cause harm to the participant).

#### Example Candidate Response – middle Examiner comments 2 Treatment for impulse control disorder and non a substance addictive disorder include many different procedures for treating the disorder. Biochemical treatment use SSRIS and MAOIs which monitor the serotenon uptake in depended brown region. And uporth on the helps The candidate identifies to maintain normal level of dopamine and 1 biochemical treatments. Serotinon. These Biochemical treatments have side effects such as obesity, change in bowl habits, gastric problems. . Covert sensitisation is amother form of treatment used to treat impuse control disorder. This treatment involves attaching on unpleasent stimilli that produce omxiety such as nausea or vomiting with the behaviour that needs to 2 Brief detail of this treatment. be changed. A case study was reported of a Worked us 56 year old women who had a history of daily shop lifting. She underwent the treatment thoughts of shoplifting daily entered her mind and then an unpleasent Stimuli was attached to it. Limits in terms of 11) Accurate evaluation point about generalisability as used only one participant the problems with generalisability with only one particular type of disorder.or of just using one participant in a addictive behaviour. Mark for (b) = 5 out of 10Total mark awarded = 9 out of 18

- (a) Brief details were given of a number of therapies and some mixing of therapies toward the end of the response. To improve, the candidate should have given more lengthy details of two to four of the treatments given in the specification. If just two were given, the case/research studies that gave evidence for the effectiveness of the treatments should have also been discussed.
- (b) The candidate should have restructured their response and discussed three or four issues rather than evaluating each treatment in turn. The answer should have started with the named issue of application to everyday life and evaluated two or three of the treatments described in part (a). Most of the evaluation points were very brief with few examples to support their points and a limited use of terminology. More extended evaluation points could have been made and as a result the candidate could have used fewer evaluation issues but discussed each in much more depth. The candidate also needed to provide some analysis. This could have been done by either providing a counter-argument or the problems psychologists might have been faced with when trying to create a study with a good sample, a valid study or a practical study.

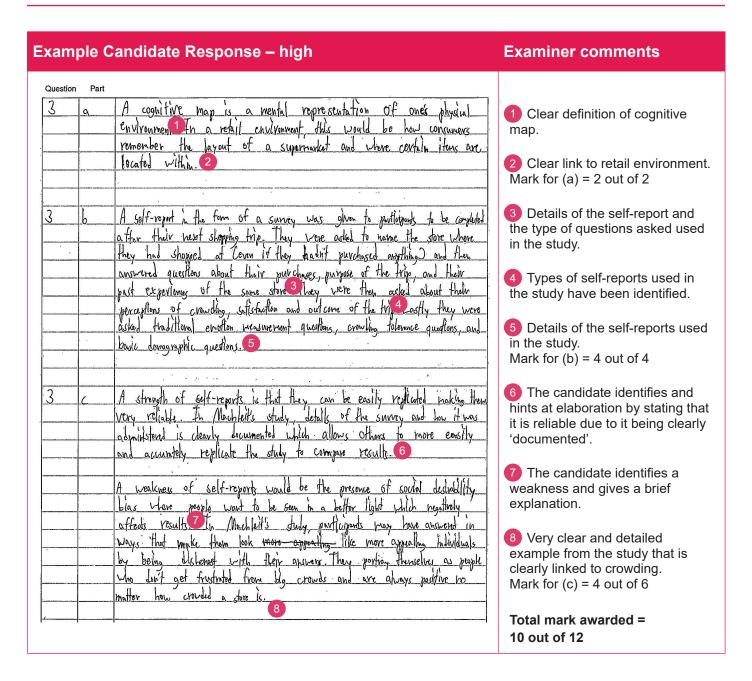

# Example Candidate Response – low **Examiner comments** disorder and not substance Impulse control addictive disorders are the one which also effect the mental health of a person example: drinking alchohol, dry addiction etc. These disorders impulse control disorders and additable disorders because the person effected 19there don't have control over from while such acts because they might be a stress or depress However, these disorders can be Arti depression to lor psychypolitable It the Appropriate treatment has been identified. Question Part potient cax follows the medical procedure without acharance, these disorders can be 2 The second appropriate Moreover, conselling treatment has been identified. profesional psychologists. Corrigi Mark for (a) = 1 out of 8 sersions 6) everyday howals. His niether 3 There is limited explanation of how therapy might help someone with obsessive-compulsive disorder (OCD). Tresaby Mark for (b) = 1 out of 10 · Psychologist again Total mark awarded = 2 out of 18

- (a) A limited description was given for the two treatments identified by the candidate. To improve, the candidate should have described the biochemical and cognitive-behavioural treatments for impulse control disorders and non-substance addictive disorder. Candidates at this level could attempt to learn at least two of the appropriate treatments in less detail and back up these descriptions with some examples of how the treatments might work in practice with these disorders.
- (b) One point was raised by this candidate that therapy could be effective for someone with OCD. In order to improve, this candidate could focus on two evaluation issues in their response. A low mark candidate may be able to use issues such as applications to everyday life and ethics in order to evaluate treatments of psychological disorders. The candidate could give some examples of why these therapies might have applications. This candidate could have explained why talking to someone each week might help the person who excessively hand washes. They could then explain why having therapy might be unethical. For example, someone who excessively hand washes might feel embarrassed about their behaviour and therefore would be unwilling to discuss this with a counsellor or feel very uncomfortable when they do discuss it. To reach the mark band 5-6 the candidate needed to provide some analysis in their response, for instance explaining that if the therapy was unethical and the patient was unable to discuss their problem, this could have a negative impact on its effectiveness.

# Common mistakes candidates made in this question

- (a) Many responses achieved a lower mark due to giving either very brief answers or answers where the causes of impulse control disorders and non-substance addiction disorders were given rather than the treatments. A number of responses appeared unaware of what constituted a non-substance addiction disorder so there were descriptions of treatments for alcoholism, which is a substance addiction. Another common error was to describe treatments for phobias or schizophrenia.
- (b) Most responses achieved in the level 2 mark band. The answers often did include reference to everyday life but tended to be structured by going through each treatment in turn and were often quite repetitive in nature and very brief for each issue mentioned. Many responses did not include any analysis and did not consider strengths and/or weaknesses of the issue, provide any counterargument or a comparison between the different treatment techniques in terms of the issue under discussion. Without this analysis, these answers could only achieve level 2 maximum. For some responses where an incorrect treatment was described in part (a), the evaluation in part (b) could not be credited as it did not address the question.

# **Question 3**

# How the candidate could have improved their answer

(c) The candidate's explanation of self-reports' weakness received full marks. To improve, the candidate needed to include more elaboration of their strength. For example, the candidate could have explained that the majority of the self-reports used, such as perceived crowding on an 8 point scale, collected quantitative data from fixed, closed questions and these could be given to participants again to check for reliability of results.

# Example Candidate Response – middle **Examiner comments** Coontille map is a Appropriate explanation of the term. Appropriate link to retail environment. Mark for (a) = 2 out of 2 The candidate identifies the correct self-report. Question Part 4 Karticipants: had to The candidate identifies a correct self-report as the study questrons asked the participants to rate a shopping trip. Mark for (b) = 2 out of 4 5 Social desirability is an appropriate weakness and the candidate gives some explanation of this weakness. 6 A appropriate strength is given with a brief link to the study. Mark for (c) = 4 out of 6 Total mark awarded = view regarding sextain sthations 8 out of 12 theitcroudling

- (b) The candidate should have identified more of the self-reports used in the study such as satisfaction (rated on a 7 point scale), emotion (5 point scale) or prior expectations of crowding (7 point scale). The participants were also asked to recall a recent shopping trip.
- (c) The candidate needed to contextualise the weakness to be more specific to the Machleit et al. study. For example, the candidate could give a brief example of the type of socially desirable response, which might be given by a participant when asked about crowding in a retail environment. To improve, the candidate could contextualise the comment about quantitative data or extend the point about being able to provide their own view (which was very briefly contextualised).

Example Candidate Response – low	Examiner comments
Question Part	
3 a Cognitive map is a map that the participant is asked to draw about what they remember about a certain area or place. This is to find out the most important features 1 people remember about what the researcher is researching about.	1 Basic definition of cognitive map which states it is a drawing from a memory of an area.  Mark for (a) = 1 out of 2
3 b The show suggested that crowding in retail entironment can cause negative effect and avoidence by the consomers. Consumers are more likely to enter a shop that is less crowded so that they can shop in peace the also Jarqued that aver crowded shops are usually said to be the discoursed stores, whereas lixing stores are affiliated with having less crowd In case of it a luxury store start getting a lat of people it can eventually tead to them	2 The candidate has not given any information about the self-reports used in the study.  Mark for (b) = 0 out of 4
Question Part	
Cone weekness can include that parkingous con add freir biased 3  opinion about their experiances, which results in the collection of invalid data. It can also be not generalized to the whole papulation.  Shength can include a collect high gualitative data as the researche parkingous has already been through the shall and exactly the crewding. The data produced is 400 easiers to produce is according.	The candidate gives the correct weakness.  4 Correct strength has been given in a limited way.  Mark for (c) = 2 out of 6
	Total mark awarded = 3 out of 12

- (a) The candidate should have provided an example of a cognitive map of a retail environment. For example, a shopper will need to use their cognitive map in order to find the items that they want in a familiar shop.
- (b) The candidate needed to describe the self-reports done in the study. In order to achieve 2 marks, the candidate should have identified two of the topics the questionnaires used in the study were measuring (e.g. crowding and satisfaction with a recent shopping trip).
- (c) One strength and one weakness were identified. To achieve marks in a higher band, the candidate needed to elaborate on both of these. Examples of both possible participant bias and the benefits of stating how you feel in the Machleit et al. study would have achieved this.

# Common mistakes candidates made in this question

- (a) A few candidates gave a definition of cognitive maps, but did not link their response to the retail environments. Others gave an incorrect definition of the term.
- (b) Many of the responses did not know any of the self-reports used in the Machleit et al. study and achieved no marks. Some did know that the study used a questionnaire on crowding but could not give any other types of self-reports used or any details of the self-report used to measure crowding.
- (c) Most gave a generic strength and/or weakness of self-reports such as bias and the strengths and weaknesses of quantitative data. Very few linked these points to the study or gave any explanation of the strength and/or weakness.

# **Question 4**

# Example Candidate Response - high **Examiner comments** 1 Many correct details of the (Auty and Lewis, 2004) study are given with a brief, general result. emiliarity The candidate gives brief details of the study with a limited reference to advertising techniques as the study used TV adverts. 3 The candidate links the study to advertising techniques.

# Example Candidate Response - high, continued **Examiner comments** bugs burny of espeniere impossible The candidate gives brief details of the study with a link at the end to advertising techniques. Mark for (a) = 6 out of 8 5 There is limited evaluation of reliability. 6 The candidate gives a brief evaluation of named issue.

# Example Candidate Response – high, continued Examiner comments recognizing equipment perhicipant cercantelive 7 The candidate gives a reasonable evaluation of population validity. reports 8 The candidate gives three, limited evaluation points that are relevant to the study. Mark for (b) = 6 out of 10 Total mark awarded = 12 out of 18

- (a) The candidate could improve their response by describing the three bullet points given in the syllabus (advertising media, marketing mix models and product placement in films) rather than two studies from the 'advertising applications' topic. The candidate did describe the Auty and Lewis study briefly but this could have been done with more elaboration of the procedure, specific results and a conclusion regarding the use of product placement as an advertising technique.
- (b) The candidate should have restructured their response to consider three or four evaluation points in turn, rather than evaluating study by study. The candidate needed to begin with the named evaluation issue about the use of children in psychological research as this could have helped the candidate to provide a more thorough discussion of this issue. The candidate could have then evaluated reliability, validity and population validity which were the issues used in the response. This could have provided an opportunity for analysis of each issue where the candidate could provide a counterargument or compare the evaluation issue between two of the studies used.

Example Candidate Response – middle	Examiner comments
is Jeen having food while has pepsi. There also was a shidy conducted on how well childred remember a certain product offer watching a movie. They were shown the same clip from hor alone and were asked to pick a drink offer watching the	1 The candidate identifies types of advertising.

Question Part  Were Oshed whether some one  Snowles in the howehold or not.  Suprisingly 60% of the children  were It able to recognise the  cigared brand this research  had less ecological validity of  as it was a laborday  experiment Both researches have  chical issues As asking children  to have fizzy claims can be  ethically word of can also  put mental shess on the  children as they would feel	7 Evaluation issue has been identified with a limited explanation.
the branch.	8 Named issue has been identified and reasonable evaluation given.  Mark for (b) = 5 out of 10
	Total mark awarded = 8 out of 18

- (a) The candidate should have given further details of the Auty and Lewis study, including the results and a conclusion. The candidate needed also to omit most of the more 'anecdotal' parts of their response (e.g. celebrity endorsements) and include details of the marketing mix models named in the syllabus.
- (b) This candidate did do some reasonable evaluation for two of the studies. To improve, they should have evaluated by issue rather than by study to enable them to give a more detailed evaluation with some analysis of the issues under consideration. The candidate did give many details of the studies which were not relevant to this question. Instead, the candidate should have altered these descriptions to further elaborate their evaluation points.

# Example Candidate Response – low Examiner comments (a) techniques and typesion advertising things. FIRSTLY Advesting Technoque Type TV, gadio for a study presenting The candidate identifies the types of advertising. (b) study Mark for (a) = 1 out of 8 exhibition No evaluation points are made. Therefore, there is nothing creditworthy in this response. adventice their nam Mark for (b) = 0 out of 10 Total mark awarded = 1 out of 18

# How the candidate could have improved their answer

- (a) The first paragraph did not answer the question. The candidate could have given some brief examples of the advertising types identified in the second paragraph. They then needed to describe at least one of the marketing mix models and the Auty and Lewis study.
- (b) The candidate needed to evaluate the advertising techniques identified in part (a) of their response. They could have discussed the effectiveness of the types of advertising raised in part (a). In addition, the candidate needed to extend their part (a) in order to provide evidence to evaluate.

# Common mistakes candidates made in this question

- (a) Many responses achieved a lower mark due to giving either very brief or anecdotal responses that listed different types of advertising. Some did go on to explain how this type of advertising works and why it might be effective but this did not address the question directly. There were few descriptions of marketing mix models or product placement in films (Auty and Lewis, 2004). A significant number of responses described information from other parts of the syllabus. A number of these types of responses instead described how consumers make decisions when they decide to buy a product and made no mention of the influence of advertising on these decisions.
- (b) Most candidates provided brief evaluation and were limited in their discussion points as their part (a) of the response was anecdotal or inappropriate to the question. Typically, the responses were structured by study rather than by issue which made it more difficult to provide detailed points or any analysis of the issue under consideration.

# **Question 5**

#### Example Candidate Response – high Examiner comments Question Part Ans Biochemical texts is a physical way of measuring non-adherence and as shown Roth, it is a valid measure. Biochemical Biochemical test has been texts involves taking sample of viine or identified. blood to see whether drug has been taken 2 Here is the reason the test shows non-adherence. P Ley suggested that practioner must improve Mark for (a) = 2 out of 2 their styles of interacting with patients such as giving important information at the stort of the appointment and highlight The guideline is given. the medical advices given so that pakents can truly understand & what the practicer tends to say and thus increase adherence. This way pakents will not forget the medical advices given and will be more likely to Follow the quidelines given increder to improve their realth The reason for guideline is stated. Second guidelin by Ley was that practioner must use words that are understood by patients well and not use medical jurgers The guideline is given and the Thuy must explain the potential costs and reason for it identified. benefits of not not alberting to medical requests. Thus ver Therefore verbal communication will be a source of schistoption For patients if it is a clear and directive. 6 Further reason is given for One strength of the guidelines is that the guideline to not use medical it helps in improving the relationship jargon. between a practioner and patient, it Mark for (b) = 4 out of 4 explains to doctors that they must

	achemence. Itoueur this is not the case as people weigh up the costs and benefit of adhering and there non-adherence is caused by many	
	other fectors such as financial fectors, social factor etc thus not solely because of 10	10 Reasons for weakness are explained.  Mark for (c) = 4 out of 6
<u> </u>		Total mark awarded =
		10 out of 12

(c) For the strength, the candidate could have explained the final point in more depth, possibly with the use of an example. To improve the weakness, the candidate should have stated that the guidelines were 'somewhat reductionist' as it was inaccurate to state they were only 'reductionist' as Ley gives a variety of different guidelines and suggests a number of reasons these guidelines could be effective to improve adherence.

# Example Candidate Response – middle **Examiner comments** Question Part Health: 05 (0) can be 1 Appropriate biomedical tests are identified. Mark for (a) = 1 out of 2 (d) instructions practitioner 1/argigns avoid med The guideline is identified. indly instruction & Shald be given in Second guideline identified. well wistructed manner with Mark for (b) = 2 out of 4 patient-friendly attitude 4 A strength is identified. (c) 5 A brief explanation for weakness has been given. Dract boner, the 6) A weakness has been identified. Mark for (c) = 3 out of 6 Total mark awarded = 6 out of 12

- (a) The candidate needed to explain how a blood or urine sample might measure adherence.
- (b) The candidate should have given a more detailed response for each guideline. This could be done with an example or an explanation of why the guideline might help to improve patient adherence.
- (c) For this response, the candidate needed to further elaborate on the strength. This could have been done by explaining how using less medical jargon could lead to better understanding. The candidate could have used an example to do this. For the weakness, the candidate should have focused on one weakness. They could have further elaborated the first weakness, which was the stronger of the two, with an example of a patient taking the information more seriously.

#### **Example Candidate Response – low Examiner comments** \* Psychology and hearth Question The higher the Scare on 5. Biochemical 1886 the higher Cover of asherence advice. alsoused check Bio Chemical how much a person improved advices in adhering metica 1 No biomedical test has been the years identified. Mark for (a) = 0 out of 2 was found 6 metical ashere to Jodas who are etample coat. One gaidline formal diesc guidline was to give a uncomplicated medicad The better the patient 2 There is basic identification of Under 2 ands an appropriate guideline. Mark for (b) = 1 out of 4 ONe Lound Samo, malls oreles 000 doctors in an was etteno Quidline one or ca Question 3 A correct weakness is and resshe identified. Bh -60 Mark for (c) = 1 out of 6 correct Total mark awarded = 2 out of 12

- (a) The candidate needed to identify a biochemical test and explain how this could identify if a patient adheres.
- (b) The first paragraph given by the candidate, about the style of dress of the practitioner, is not one of Ley's guidelines and should have been removed. Instead, this candidate should have identified two of the guidelines given by Ley (e.g. do not use medical jargon and emphasise key information to patients). The candidate could then achieve in the 3–4 mark band by explaining why each guideline might have improved adherence.
- (c) The weakness given by the candidate was unclear but also related to the study about style of clothing which is not from Ley. The strength given was correct. Instead, the candidate could give an example of some medical advice that might be easier to follow using Ley's guidelines.

# Common mistakes candidates made in this question

- (a) Some candidates did not identify any appropriate biochemical test to measure adherence and few identified a psychological test. Another common mistake was to not explain why the test could show levels of adherence in patients.
- (b) Many candidates made reference to practitioner style of dress/clothing which was not one of Ley's guidelines. As a result, many just gave one correct guideline. In addition, many responses were very brief where the guideline was identified rather than explained.
- (c) Further reference was often made to practitioner style of dress and none of these strengths and/or weaknesses were creditworthy. Candidates found it difficult to write a band 5–6 mark response as their responses were often fairly brief. Many just identified a strength and/or weakness with no elaboration.

# **Question 6**

#### Example Candidate Response – high Examiner comments Stress is said to be the emotion experienced when percioved demands exceed the perceived available nources. Stress can lead to long term illnessence if its not treated immediately. Medically it can be treated by the use of anti depressants like Prozac or antianxiety drugs like benjodizapiene. 1 Kahn etal conducted a 1) The candidate gives study on 2 groups, one treated by benzodizapiece and the other by placebo and found significant appropriate treatment and examples. improvement in the former group 2 Apart from In alt bio feedback is an effective technique. It involves altaching electrodes to the patient Brief details of this study have been given. which report immediately back to the patient after measuring physiological levels like pulse rate and blood pressurewhich if increase to high pitch sound is heard and if maintained a low pitch is head 3 Bud zynski conducted a study with a control groups and I experi-3 Clear details of biofeedback mental group to treat fension headaches Cassociated with fight scalp and neck has been given. muscles). The control group I had to relan with a continous low pitch sound. Control group 2 had to relax without any sound. Explimental group had to maintain the low pitch and not allow high pitch to be head by relaxing-Results showed the experimental group showing improved results over the other 2.4 Imagery is also used to reduce stress which The candidate gives a detailed involves closing the eyes relaxing visualidescription of the study. zing a relaxed atmosphere beach, surely Primersing onesely in it and relaxing and thinking about how one can return to it any time 5 Bridge eral used it to treat women undergoing cancer treatment. He meanined 5 The candidate gives appropriate details of a treatment given.

# Example Candidate Response – high, continued Examiner comments Question Part stress levels by a leeds anxiety scale and a 65 item mood scale before and after buk cancer breatment of the women who were divided in 3 groups (a relaxation, on imagery and planation a control). leeds anxiety cates howed no change however the mood scale showed the relax. ation + imagery group had high improvent, 6 A clear and detailed description of this study is given. To manage Stress (SIT) stress inoculation training is also used which believes that Stress is a perception that can change by Corceptualization Skill acquis ( bion and Application & followp in reallife. It beliefs stress is not an obstacle but a posse to be 17 ved Details of stress inoculation therapy. Stress can be managed by varying techniques but as stressors are different for every one it as vital to find the correct way to Mark for (a) = 8 out of 8 02 treat every individ. Medically ctress is treated by antianxity arogs which are very useful as they are' can objective and easy way of treating 18 8 Usefulness is identified and is stress. However this way of treating strep is quite reductionist and completely ignore briefly explained. the nurve approach and the environment factors causing stress which if not looked into will never solve the underlying root stress. They consider it to be a neural biochemital imbalance Biogedback 9 This an appropriate evaluation is a much more useful method in that it issue but has been explained in a reinforces patients behavior. If they are limited/confusing manner.

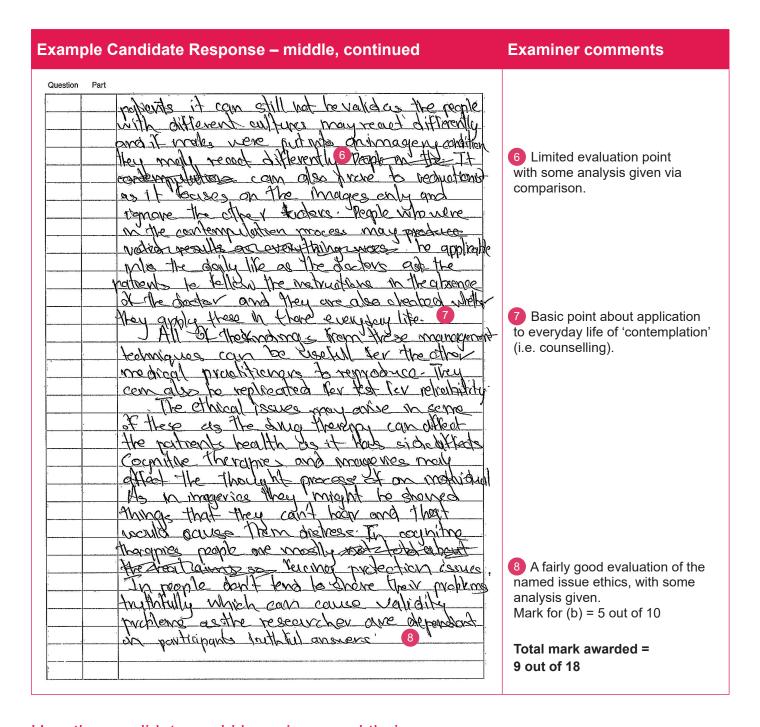

#### Example Candidate Response – high, continued **Examiner comments** Question Part relaxing and alow pitch is heard it will reinforce their behavior flowerer the vorying 10 Analysis given with the use of the word 'however', but it is very Sound's cantle distressing for the individual and limited. indimals of all Its important to relieve Vital Part of Ethics , which elistress on its a are the set of quidelines which must be for well 11) Named evaluation issue addressed with some analysis Bridge also conclucted his study on cance given at the start. patients which can be distressing and hard to relax when death Idoms over chem so its vital to take their consenti-Its a useful approach as it allows however relaration is a very quick 12 A number of evaluation issues have been identified, but a basic S.I. #### How the candidate could have improved their answer

(b) This candidate could restructure their response to evaluate issue by issue rather than by treatment. This would have enabled the candidate to give more details and elaboration of each evaluation issue as well as to provide some analysis. The candidate could start each issue by explaining why this issue was important to the treatment of stress. Candidates should avoid making similar statements for each treatment as this is repetitive and would not be considered good evaluation.

### **Example Candidate Response - middle Examiner comments** that can be behavieur different some variount experience poust expreviona Yer through stressed symplishes 1 Appropriate drug therapy has The neurotramponities. been given with some details of its preases function. fer example morrage 2 The candidate identifies cognitive behavioural therapy Especially (CBT) but gives some basic detail of how this treatment might work.

## Example Candidate Response – middle, continued **Examiner comments** Question Part Jesthers to be done to wandade queda 00000 were chowed small 3 Imagery has been identified but very brief details of the study have culandingsien been given. nations 4 Treatment is described although not identified. Mark for (a) = 4 out of 8 5 Three evaluation points are COM identified with a basic description place wa real hospoital given of each.

- (a) The first paragraph described the causes of stress rather than a treatment. The candidate could extend their description of drug therapy as well as describing a study that shows whether drug therapy is effective in treating stress. The description of CBT was unclear and an example of how this might work with a person who is stressed would have improved this response. Imagery could also be extended with an example or further details of the study. The final treatment appeared to be counselling. This could be extended with direct reference to stress.
- (b) As this candidate included a number of treatments, they would have improved their response as well as the time management of the paper by describing three treatments in more depth with clear details of one or two studies that show how these treatments could be effective.

The response should have evaluated issue by issue rather than study by study as they have done. They should have started with, ethics as this was the named issue and given some examples from treatments that highlighted how the treatment might be considered ethical, and also why it might not be considered ethical. This would have enabled them to show analysis in their response. Reductionism and validity could be their other two issues as these were addressed in their response in a limited way.

#### Example Candidate Response – low **Examiner comments** Stress is good if its not severe because stress help us to work more under pressure so we do it quickly. but too much green can lead to heart diseases too. - (a) Two treatments were given in this response. The first treatment should have been extended with examples of drugs that a patient with high stress levels might take. This description could then be extended with a study showing the effectiveness of drug therapy. Secondly, imagery needed to be identified and a clear and detailed description of this treatment should have been given. The study by Bridge could then be described by the candidate.
- (b) fMRI was not an appropriate treatment for stress and measures of saliva was a measure rather than a treatment. The evaluation points given (ethics and effectiveness) would have been better structured as two separate paragraphs. The candidate could have evaluated the ethics of both treatments given as well as discussing why it might be necessary to break some ethical guidelines in order to help the patient.

#### Common mistakes candidates made in this question

- (a) A number of candidates gave very long descriptions of definitions and causes of stress which were not awarded marks. Some then described four or five different treatments. These were often just identified with a very brief description given for each treatment. These responses were considered to be limited. Details of the studies used were often absent with vague reference to findings and/or conclusions.
- (b) Weaker responses took each separate treatment described in (a) in turn, and evaluated it for a few issues. Unfortunately this tended to mean that the evaluation lacked depth. A significant number of candidates did not answer the question and instead simply wrote more about treatments, causes or explanations which were not creditworthy. Many responses did not include any analysis and did not consider strengths and/or weaknesses of the issue, provide any counterargument or a comparison between the different stress management techniques in terms of the issue under discussion. Without this analysis, these answers could only achieve level 2 maximum.

#### **Question 7**

- (b) The candidate should have given an example of one of the statements used in the Minnesota satisfaction questionnaire.
- (c) To improve the strength the candidate could describe how the two self-reports are similar, as both collect quantitative data where the worker has a choice of more than two responses.

#### Example Candidate Response – middle **Examiner comments** Question Part Job absentein may be due a) organizational committement of a That they are not motivated work and do not feel themsolves show upto with the argumention. Mark for (c) = 4 out of 6 Total mark awarded = 6 out of 12

- (a) The candidate could have identified either voluntary or involuntary absenteeism and either described this or gave an example of either to improve their response. Alternatively, the candidate could have described one of the following: career enhancing absences, medical, normative absences or calculative absences.
- (b) The candidate should have used the titles used in the Minnesota questionnaire for each scale such as 'security'. The candidate could also have given an example of one of the statements as well as the scale used to measure satisfaction.
- (c) To improve the similarity, the candidate should have described how the quantitative data was collected or how the total scores were calculated in the two questionnaires. For the difference, the candidate could elaborate their response further by explaining the purpose of the comparison group.

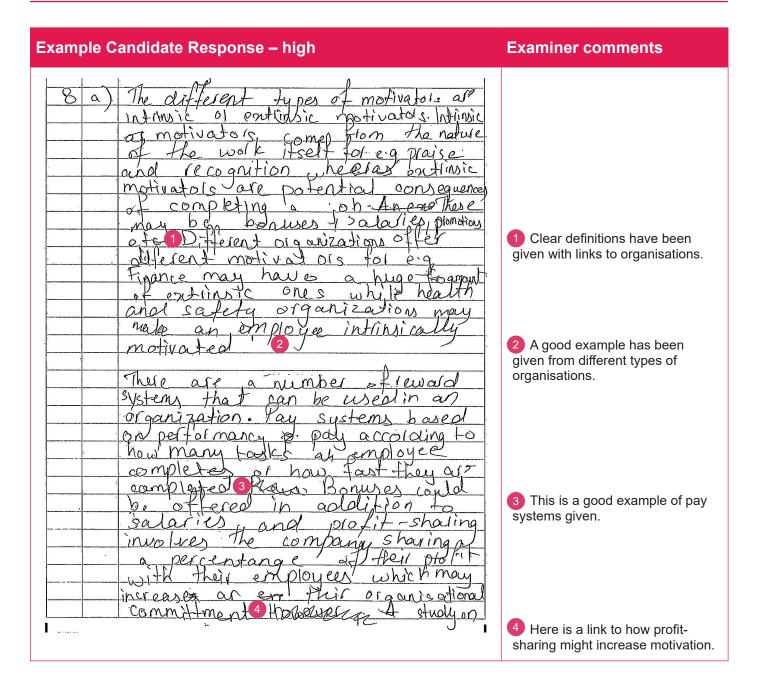

# **Example Candidate Response – low Examiner comments** Psychology and Organisations a' Mark for (a) = 0 out of 2 wor Levs Druover because Minnesota not abstill Question Part WOYKOVS indivially 1 Basic indication of the scale used in the questionnaire. Mark for (b) = 1 out of 4 <u>د)</u> ton measure majorite 2 Both incorrect and not >algry creditworthy. Mark for (c) = 0 out of 6 Total mark awarded = 1 out of 12

- (a) The candidate could identify either voluntary or involuntary absenteeism and either describe this or give an example of either to improve their response. Alternatively the candidate could have described one of the following: career enhancing absences, medical, normative absences or calculative absences.
- (b) The candidate should have used the wording of the scale from the Minnesota satisfaction questionnaire which was a 5 point scale from 'very dissatisfied' to 'very satisfied'. In addition, this candidate could identify the topics covered and give an example of one of the statements used.
- (c) The first paragraph was just a description of the job descriptive index and not a comparison point. As the comparison points are incorrect, the candidate could have explained that the job descriptive index has 5 dimensions whereas the Minnesota satisfaction questionnaire has 20. For the similarity the candidate could have discussed how these two questionnaires could be useful to organisations in determining the satisfaction levels of their workers.

#### Common mistakes candidates made in this question

- (a) Many candidates described lack of motivation as a type of job absenteeism. While this could be a reason for absence it is not a type of absenteeism which is either voluntary, involuntary, career enhancing absences, medical, normative absences or calculative absences. A number of responses just identified or gave very brief details of the type of job absenteeism (e.g. illness) which achieved 1 mark.
- (b) Some responses were very brief and often stated that the Minnesota satisfaction questionnaire measured worker satisfaction. These responses did not give any specific details of the questionnaire.
- (c) Some candidates described another questionnaire rather than giving a comparison point. Weaker responses that did give a comparison point tended to be very brief with the point just identified rather than elaborated.

### **Question 8**

# Example Candidate Response - high, continued **Examiner comments** Question Part 5 Evidence has been given of bonuses. pestormano nition 6 The candidate identifies types of non-monetary rewards. Mtion organisations in Here is a clear link to motivation of workers.

Brief reference to two pieces of evidence. Mark for (a) = 7 out of 8  Reasonable evaluation with an example of how it might be applied in everyday life. Some analysis provided by considering the implications of motivators at work.  Evaluation of the named issue in the question with some elaboration.

# Example Candidate Response – high, continued **Examiner comments** Write on both sides of the paper Page do 11 Clear evaluation with an example. \*101S 100 12 Analysis given as the response shows that the candidate understands the implications of attempting to carry out a piece of research on organisations in a lab environment. 13 Correct point has been made regarding nurture. Mark for (b) = 7 out of 10 Total mark awarded = re cogni 14 out of 18

- (a) The candidate should have given more details of how some of the motivators mentioned might improve motivation in a worker. The candidate did this on occasion in their response but they should have done it more frequently or given more details of two.
- (b) The candidate should have expanded each of their evaluation issues and possibly omitted the last point on nature vs nurture as this was the weakest in their response. They could have explained the implications of reductionism in more depth to provide further analysis in their answer.

## **Example Candidate Response – middle Examiner comments** 8 Extrasic Motivetors are the approximals work. The removeds in exprinsic include bonus or a day off or paid vert 1 Extrinsic motivation is motivetion explained with some examples given. 2 These con 1d 2 Basic definition of intrinsic motivation. needs. When you are content with 3 The candidate identifies types of motivators. Question 4 Many examples have been appraised given of monetary and nonmonetary rewards. Mark for (a) = 4 out of 8 5 Limited evaluation point addressing the named issue of reductionism. 6 Some elaboration that suggests extrinsic 'factors' ignore ERG theory. Basic evaluation of the named ş. evaluation issue in the question. Mark for (b) = 3 out of 8 Total mark awarded = 7 out of 18

- (a) This candidate could have improved the answer by linking their definition of intrinsic motivation to organisation and giving some examples of what might cause this type of motivation (e.g. a desire to feel satisfied with one's work). In addition, the candidate could describe in more depth how the monetary and non-monetary rewards might lead to more motivation at work.
- (b) The candidate should have addressed at least one more evaluation issue and ideally two. The candidate could consider individual differences as well as practical issues with motivating workers and the expense of monetary rewards. No analysis was provided so the candidate needed to consider whether the evaluation points raised cause any issues for organisations or if these issues were different for the different types of motivating factors described in part (a).

#### **Example Candidate Response – low Examiner comments** Question 8 Different psychologists have looked into how to keep your staff motivated. They have divided these studies into two types first being Need Theories. Need theories begin with Maslow's Heiranchy which emplain human needs into eight needs. The loast in his heirarchy Physiological needs which consist is basis necessaties like food, water, Shelter. Then comes one safety needs which are described as security or life security e.g. huildings. Then come love & belongingness reeds, there are our needs for family, friends etc relationships with our Estern fulfilled by recognition appreciation at work through reward systems. After that cognitive needs heed for Mormation Ment up the heirarchy are our needs ie the need comes our self actualisation needs which full potential. 18 realling one's & then then the Least 13 tran sendence need, need

# Example Candidate Response - low, continued **Examiner comments** Question Part Basic link has been made to motivation. 2 Motivators have been identified. 3 Types of motivators used as an example. ### Example Candidate Response - low, continued **Examiner comments** Question Part 8 Maylow Theory describes on needs which to interpret. This Alder fere werk mahor Alderfers heirarch UV achieved 6 Basic evaluation with some Corri reference to generalisability. Mark for (b) = 1 out of 10 werker com beclive there's Où. personal what motivator vement. There no co grifien relatable.

ample Candidate Response – low, continued	Examiner comments
These theories are followed with  (ognitive theories which include  Vroom empetancy theory:  Equity theory.  When pair equality heeps the  workers motivated.  Enpertancy theory states three  stages valence, this trumentality.  If Empertancy.  Valence is described as the  value for the need Antimentality  is the roost belter in relationship  of works effort and performance.  Empertancy is the belief theat  the employees will get promised  neard, this heeps the workers  nuctivated for the tank.	Total mark awarded = 4 out of 18

- (a) The candidate should have given details of the three bullet points under the topic area of motivators at work. To gain more marks the candidate should have explained how the desire to achieve further up Maslow's hierarchy of needs could motivate an employee. The candidate could then give an example of how this might happen in an organisation.
- (b) This candidate could have improved their response by omitting the descriptions of the further theories of motivation (e.g. Vroom) as this did not answer the question. The candidate should have begun with a paragraph on the named issue of reductionism and considered whether the theories and types of motivators described in part (a) were reductionist or not. The candidate then should have evaluated the application to everyday life of motivators at work and the issues faced by organisations when they try to motivate their staff.

#### Common mistakes candidates made in this question

- (a) Many just focused on general definitions of intrinsic and extrinsic motivation with few, if any, examples from organisations. Often monetary and non-monetary rewards were listed in the responses rather than described in any depth or any elaboration given of how these rewards might lead to increased motivation.
- (b) Candidate responses that were in the level 1 or level 2 mark band often made very brief points regarding a number of evaluation issues that did not include any explanation or justification of the points raised by the candidates. Some also included further descriptions of the motivators and/or theories of motivation at work which was not creditworthy for this question. Most responses did not include any analysis and did not consider strengths and/or weaknesses of the issue, provide any counterargument or a comparison between the different motivators in terms of the issue under discussion. Without this analysis, these answers could only achieve level 2 maximum.
