MARK SCHEME for the October/November 2010 question paper

for the guidance of teachers

0680 ENVIRONMENTAL MANAGEMENT

0680/21 Paper 2, maximum raw mark 80

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes must be read in conjunction with the question papers and the report on the examination.

• CIE will not enter into discussions or correspondence in connection with these mark schemes.

CIE is publishing the mark schemes for the October/November 2010 question papers for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level syllabuses and some Ordinary Level syllabuses.

Page 2		2	Mark Scheme: Teachers' version	Syllabus	Paper
z			IGCSE – October/November 2010	0680	21
1	1 (a) (i) Moving apart / away from each other towards west and		east;	[1]	
	(ii)	Con	structive / diverging;		[1]
	(iii) At this plate boundary / as plates diverge magma reaches the surface. New material from mantle / interior of the Earth. Eruptions of lava are frequent / regular. Usually non-violent outpourings of runny lava / basalt.				
		Two	points made along these lines = 2 marks		[2]
	(iv)	Des Surf	thermal power named. cription about how it is obtained – up to all 3 marks. ace sources of hot / boiling water such as hot spring d to heat buildings and homes.		and
		Any	route to three marks		[3]
	(v)	Eura One Grea	es are moving together which makes it a destructive asian plate is crashing up against Indo-Australian / A plate (oceanic plate) is destroyed in the subduction at friction / pressure as rock is forced to move again ates shock waves underground felt at the surface as	African plates. zone. st rock.	
			sible to use a sketch to show some of these points, r points made along these lines.	equally valid.	[4]
	(b) (i)	To stop buildings from collapsing: Steel frames, damping and bracing systems, foundation piles of alternate layers of ste and rubber, good quality building materials, checks made that builders are sticking standards set, low rise buildings.			
	(ii)	Trai	educe number of deaths after the quake: n specialist emergency and rescue teams ready fo kpiles of emergency supplies such as tents, blanke		

Other points can be considered if relevant and precise. Credit both separate and developed points. [5]

Min 2, max 3 for each part, but in exceptional circumstances allow 4:1.

and people educated in advance about what to do.

		IGCSE – October/November 2010	0680	21
(c) (i)	Varie and r Large	ally impossible to know exact numbers of dead. ety of reasons for this such as buried bodies not rea remoteness of the location. er the earthquake / casualties then the less the cha ts made along these lines 2 @ 1 mark		
<i>(</i> 11)				
(11)	Indor	nesia and Iran.		[1]
(iii)	Some One Gaps Conc	egular / uneven pattern / haphazard. e years with none (e.g. 2000, 2002, 2007), year with three (2005). s between them within a year variable as well / som centration in the years 2003–06.	netimes consecutiv	
	Two	descriptive points such as these		[2]
(iv)	along	eliable chance of people predicting when and whe g the boundary are more at risk of activity, althoug ins at risk.	-	
		eral conclusion stated = 1 mark prated upon with table evidence = 1 mark		[2]
(v)	The s Two	ence for this includes: strongest (Indonesia 2004) had greatest loss of life other strong ones (7.9 and 7.6) had big losses of li t strong (Iran 2006) had smallest loss of life.		
	Only Third It and	ence against this includes: 1300 dead in the second strongest. I largest loss of life (Iran 2003) was among least str d another at 6.5 varied greatly with loss of life (30,0 e variations in deaths for earthquakes between 6.0	00 and 300).	
	Gene	ts made along these lines. eral point = 1 mark Supported by comment to appr 1 and max. 3 for each of 'for' and 'against'.	opriate references	s = 2 marks. [4]
(vi)	There	nger for the earthquakes of greater strength above e is definitely an element of truth in it but with wide rs that might matter more than strength such as loo	e variations, mentio	on in passing of
		with some support = 1 mark supported view = 2 marks		[2]

Page 4	Mark Scheme: Teachers' version	Syllabus	Paper
	IGCSE – October/November 2010	0680	21
		•	

(d) (i) Nineteenth.

Many of them, with six in a 50 year period in the middle of the century.

Twentieth.

Only two of them, with long gaps between eruptions (34 years, 38 years and 56 years).

Weakly stated difference / unsupported / very one sided = 1 mark. Well supported difference stated = 2 marks.

- (ii) Fertile soils or its equivalent such as minerals in an agricultural context. [1]
- (iii) Realisation that they are all ways of monitoring changes to give as early a warning as possible of a full eruption. 1 mark.

Further descriptive comment such as: Seismograph and tiltmeters record physical movements / changes. The other two are more to do with heating up and signs of increased activity. Comment about how either of these are useful indicators. Earthquakes sometimes trigger off volcanic eruptions.

2 points made = 2 marks Overall 1 mark + 2 marks

[3]

[2]

(iv) Increase in activity may not lead to a full eruption / all the activity may be confined to the crater.

Volcanoes (especially those on destructive margins) are unpredictable. Pressure building up inside the volcano may have no external signs with an eruption that is sudden and violent.

One worthwhile suggestion = 1 mark. Fuller elaboration, or wider range of suggestions = 2 marks. [2]

(v) Easy?

Italy is one of the rich developed countries; developed countries have the money to make advance plans and train people to put it into effect.

There is a plentiful transport system of roads, railways, private cars.

Difficult?

Massive logistical problems in trying to move those numbers of people in only a short period of time; and to where?

Problems of persuading people to leave before an actual eruption begins.

Reasons for people's reluctance to leave homes and possessions behind, such as fears from looting etc.

Many people will believe that the volcano will not affect them.

Comments made along these lines, for any answers from all easy to all difficult. No need to address both sides for full marks.

Some comment but not developed – points mentioned rather than explained = 1–2 marks. Fuller comment showing wider appreciation = 3 marks. [3]

[Total: 40]

Page 5	Mark Scheme: Teachers' version	Syllabus	Paper
	IGCSE – October/November 2010	0680	21

2 (a) (i) Correct plot = 2 marks.

One segment correct = 1 mark. Completing the key (provided that the graph is attempted) = 1 mark.

[3]

(ii) Water vapour

This is the source for cloud formation and precipitation in the atmosphere (water cycle). Water is needed for plants (the producers) to grow and to keep both animals and humans alive. Water is lost by transpiration and perspiration.

Carbon dioxide

Soaked up by plants for photosynthesis; plants are the producers upon which consumers depend, herbivores directly and carnivores indirectly, and they release oxygen – also it absorbs heat radiated from the surface and stops the Earth cooling down massively on a night. Without it, the Earth would be much colder and lifeless.

Ozone

Located high in the atmosphere, it absorbs ultraviolet rays which would otherwise harm plants, animals and humans (e.g. skin cancer).

Minimum 1 mark, maximum 3 marks for each of these.Otherwise any combination / route to the 6 mark total.[6]

(iii) Through various cycles and energy flows,

e.g. carbon cycle: from intake of carbon dioxide by green plants to decay and respiration by plants and animals, e.g. nitrogen cycle from use by plants after the work of bacteria in root nodules to death, decay and excretion from plants and animals, return to atmosphere by dentrifying bacteria.

Basic idea or mention of cycle(s) without use = 1 mark.	
Elaboration or exemplification = 2 or 3 marks.	[3]

- (b) (i) Line drawn linking tops of bars to show trend.
 - (ii) Before 1960.
 Steady (but persistent) increase.
 Increase of 140 billion tonnes in 100 years.

After 1960. Noticeably faster increase. Larger increase of 200 billion tonnes in just 40 years.

Trends without fully establishing the difference = 1 mark.	
Trends with difference emphasised = 2 marks.	
Emphasised trends supported by use of values = 3 marks.	[3]

 (iii) 'Thicker layer' / greater concentration of carbon dioxide in the upper atmosphere. More radiated heat trapped while incoming sunlight stays the same. The greenhouse effect, accelerating a natural process to increase average world temperatures by about 0.8°C between 1900 & 2000. Carbon dioxide is just one of the greenhouse gases along with methane, CFCs and nitrogen oxides.

Three points made along these lines.

[1]

Page 6	Mark Scheme: Teachers' version	Syllabus	Paper
	IGCSE – October/November 2010	0680	21
Chinamo	ether they account for about half of total world emi na responsible for slightly more carbon dioxide em ount per head than in USA. head consumption in USA is 4 times greater than	nissions than USA,	but much lower
Thre	ee of these.		[3]
The Goo Mov	ny industries owned by American companies have by have taken their carbon emissions with them. ods made in Chinese factories are exported and so ving emissions to China has left the USA a cleaner of further comment about the reasons for this mover	old in the USA. Place.	
Thre	ee points made along these lines.		[3]
Rising s Sea def Flooding	f infilling for the boxes: ea levels. ences breached. g of low lying coastal areas such as deltas. sly populated areas abandoned.		
2 or 3 co	ed in the correct order = 3 marks. prrect = 2 marks. t = 1 mark.		[3]

(e) (i) Nowhere on the Maldives is above 2.4 metres above sea level; unlike other countries, there is no place to retreat away to avoid rising sea levels, and its income heavily dependent on tourism will just disappear.

Some understanding = 1 mark. Well understood including comparative mention with other countries = 2 marks. [2]

(ii) Only answer easy to justify is totally true if climate change is due to the enhanced greenhouse effect. This is because industries and transport in developed countries have mainly been responsible for the emissions, the USA in particular, many of which have been reluctant to adopt measures for a reduction. Also relevant are references to recent and likely future increases in China and India.

OR

A supported view that climate change is natural is a way to try to explain a partly true or a not true answer.

View and some supporting explanation = 1 mark Precisely explained / supported view = 2 marks

(iii) Possible problems:

Finding a country willing to sell land. Land and environments elsewhere are likely to be very different from home. What will the economic opportunities be? Getting everyone to leave especially as flooding is likely to be phased.

Likely problem identified with little further description = 1 mark. Identified and further elaborated upon = 2 marks.

[2]

[2]

Page 7	Mark Scheme: Teachers' version	Syllabus	Paper
	IGCSE – October/November 2010	0680	21

(f) (i) Person B

Some of these climatic disasters are regular events in the areas named.

e.g. annual monsoon in India, cyclone season each year in Bangladesh.

Ethiopia is on the edge of the Sahara desert and in the Sahel. They are to do with the world pattern of pressure and winds i.e. normal climatic events, such as the hurricane season in the Gulf of Mexico.

Person C

Poor people in developing countries are more badly affected by natural hazards than are rich people in developed countries. The answer lies in preparation before the event and provision of emergency services after the event, both of which are money related (for both people and the economy).

Reference also to big populations and rapidly increasing populations in Asia and Africa could also be made.

Views explained – 2 marks for each view 2 @ 2 marks. (Exceptionally only allow 3:1 or 1:3).

[4]

(ii) Some people like A are now of the opinion that climate change is causing climate hazards that already exist to be worse / more intense / more frequent e.g. stronger cyclone seasons, more protracted droughts.

However, it is possible that because of better communications more people learn about them faster; it could be that there are simply more people to be affected in areas regularly hit by them.

Explaining strength of view A, or why the views of B and C may be stronger. Mark the explanation rather than the view expressed.

Statements made that support view taken = 1 mark. 'How far' part of the question addressed as well = 2 marks.
