## **READ THESE INSTRUCTIONS FIRST**

No Additional Materials are required.

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs, tables or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

| For Examiner's Use |  |

This document consists of 15 printed pages and 1 blank page.

1 (a) A student did an experiment to investigate the effect of light on the mass of seeds during germination and early growth of seedlings.

For Examiner's Use

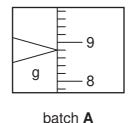

She used two batches of 10 seeds. Batch **A** was left in daylight. Batch **B** was kept in the dark throughout the experiment. Both batches were supplied with water.

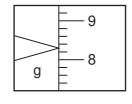

She measured the mass of the two batches before the experiment, and then at intervals for one week. By this time both batches of seedlings had produced leaves. The seedlings that were grown in the dark were about twice as tall as those grown in the light.

Read the balance windows in Fig. 1.1. These show the initial masses of the seeds.

Enter the readings in Table 1.2.

[2]

**2** A student wrote the following statement:

"When two lamps are connected in series, the total power output is half of the power output of a single lamp."

For Examiner's Use

He tested this statement by doing two experiments shown in Fig. 2.1 and Fig. 2.2.

A V

Fig. 2.1

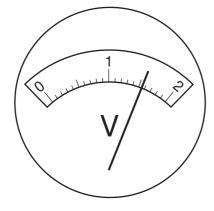

Fig. 2.2

- He connected up the circuit shown in Fig. 2.1.
- He closed the switch and read the ammeter and voltmeter, then recorded the readings in Table 2.3.
- He added another lamp, the same as the first lamp, as shown in Fig. 2.2.
- He closed the switch, read the ammeter and voltmeter again and recorded the readings in Table 2.3.

Table 2.3

|             | current/A | voltage/V | power output, equal to current x voltage |
|-------------|-----------|-----------|--|
| single lamp | 0.25      |           |  |
| two lamps   | 0.12      |           |  |

(a) (i) Fig. 2.4 shows the voltmeters for the circuits in Fig. 2.1 and Fig. 2.2. Read the voltages and record them in Table 2.3. [2]

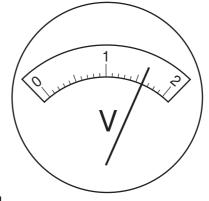

Fig. 2.4

- (ii) Find the value of the power for each circuit by multiplying the current by the voltage. Record the values in Table 2.3. [2]
- (iii) What is the unit of power for these values?

[1]

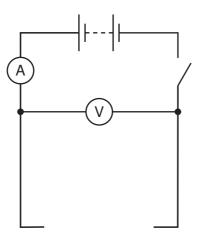

Another student wrote the following statement.

"When two lamps are connected in parallel, the total power output is double that for a single lamp."

For Examiner's Use

He altered the circuit shown in Fig. 2.2 so that the two lamps were in parallel.

(b) (i) Complete the circuit shown in Fig. 2.5 by drawing two lamps in parallel.

[1]

Fig. 2.5

(ii) Fig. 2.6 shows the ammeter in the circuit, Fig. 2.5.

[1]

Record the reading in Table 2.7.

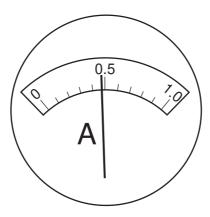

Fig. 2.6

Table 2.7

| ammeter reading/A | voltmeter reading/V | power output, equal to current x voltage |
|-------------------|---------------------|--|
|                   | 1.5                 |  |

|     | (iii) Complete Table 2.7 by calculating the power output of the lamps.   | For<br>Examiner's<br>Use |
|-----|--|--------------------------|
|     | [1]  |                          |
| (c) | Compare the data in Table 2.3 and Table 2.7. Comment on the <b>two</b> statements made by the students.              |                          |
|     | [1]  |                          |
| (d) | What other piece of apparatus must be used in an experiment to find the total energy used by the lamps in a circuit? |                          |
|     | [1]  |                          |

© UCLES 2010 0653/61/O/N/10 3 The science teacher gives a student a sample of compound **X**. It is a light green crystalline solid. The student carries out the experiments shown in Table 3.1 to find out what compound **X** contains.

For Examiner's Use

Complete Table 3.1.

Table 3.1

|       | test  | observations  | conclusions   |
|-------|---|---|---|
| (a)   | Add compound <b>X</b> to aqueous sodium hydroxide and warm the mixture.                       | A strong smelling gas is given off. The gas turns litmus  [1]                           | The gas is [1] Compound <b>X</b> contains [1] ions. |
| (b)   | Dissolve compound <b>X</b> in water. Divide the resulting solution <b>X</b> into three parts. |   |   |
| (i)   | To the first part of solution <b>X</b> , add aqueous sodium hydroxide.                        | There is a green precipitate which turns brown after standing in air for a few minutes. | The precipitate is [1] hydroxide. This turns to     |
|       |   |   | hydroxide by a process known as                     |
|       |   |   | [1]   |
| (ii)  | To the second part of solution <b>X</b> , add dilute hydrochloric acid followed by aqueous    | [1]   | Compound <b>X</b> contains sulfate ions.            |
| (iii) | To the third part of solution <b>X</b> , add dilute   |   | Commound V daga vast                                |
|       | acid followed by aqueous  | No precipitate is formed.   | Compound <b>X</b> does not contain chloride ions.   |
|       | [2]   |   |   |

4 A science student visits a café and notices that a drink is heated by passing steam into it. He decides to do an experiment in the laboratory to find out how steam can heat up water. The apparatus is shown in Fig. 4.1.

For Examiner's Use

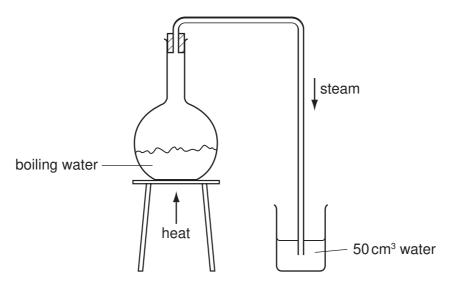

Fig. 4.1

- He places 50 cm<sup>3</sup> of water in a beaker.
- He weighs the beaker containing the water, mass m<sub>1</sub>.
- He finds the temperature of the water, temperature  $t_1$ .
- He passes steam into the water for a few minutes.
- He finds the temperature, t<sub>2</sub>, of the water after passing the steam.
- He weighs the beaker and water again, mass m<sub>2</sub>.
- (a) Read the thermometer scales shown in Fig. 4.2 and record the temperatures  $\mathbf{t_1}$  and  $\mathbf{t_2}$  in Table 4.4.

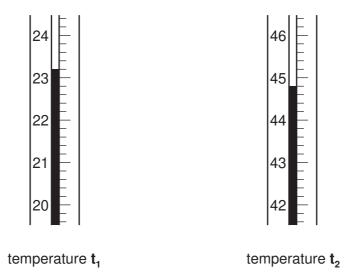

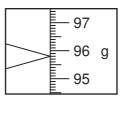

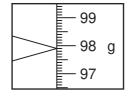

Fig. 4.2

© UCLES 2010 0653/61/O/N/10

(b) Read the balance windows shown in Fig. 4.3 and record the masses  $m_1$  and  $m_2$  in Table 4.4. [2]

For Examiner's Use

mass m<sub>1</sub>

mass m<sub>2</sub>

5 This question is about the diseases kwashiorkor and diabetes, and how changes in the diet can help sufferers.

For Examiner's Use

(a) Kwashiorkor is caused by a lack of protein in the diet. A student was given five solutions, **A** to **E**, each of which contained either protein, starch or glucose. Two of them contained protein that may help a kwashiorkor sufferer.

She tested solutions **A** to **E** with biuret solution.

Table 5.1

| solution | colour observed |                 |                     |  |
|----------|-----------------|-----------------|---------------------|--|
| Solution | biuret solution | iodine solution | Benedict's solution |  |
| Α        |                 |                 | blue                |  |
| В        |                 |                 |                     |  |
| С        |                 |                 |                     |  |
| D        |                 |                 | red                 |  |
| E        |                 |                 |                     |  |

In the second column of Table 5.1, record the colours she saw when the five tubes were tested with biuret solution. Solutions **C** and **E** contained protein. [2]

**(b)** Sufferers of diabetes are often advised to eat their carbohydrate in the form of starch rather than sugar.

The student tested the remaining solutions to find out which one contained starch by adding a few drops of iodine to fresh samples. Tube **B** produced a positive test for starch.

In the third column of Table 5.1, record the colours seen in all the tubes, tested with iodine solution. [2]

(c) There now remained **two** unidentified solutions, **A** and **D**. One of these contained the reducing sugar glucose. It is recommended that the diabetic should avoid eating large amounts of glucose.

She tested these two solutions for glucose using Benedict's solution.

The results of this test are shown in Table 5.1.

Which solution contained glucose?

Explain your answer.

© UCLES 2010 0653/61/O/N/10 **[Turn over** 

| (d) | One of the <b>two</b> protein solutions contained the enzyme amylase which catalyses the break-down of starch to sugar. |

|     |             |                                   |  |      |  |
|     | •••••       |                                   |  | [1]  |  |
| (c) |             | colourless liquid                 | a few cm <sup>3</sup> of aqueous potassium iodide, KI, in a gas-jar of chlor turns brown. Then she adds two drops of starch solution.  nen the starch solution is added?                 | ine. |  |
|     | (')         | What is seen win                  | on the staten solution is added:   | [1]  |  |
|     | /::\        | Write a balance                   | d acception for the greation between ablering and naturalism indi  |      |  |
|     | (ii)        | vvrite a balanced                 | d equation for the reaction between chlorine and potassium iodi  |      |  |
|     |             |                                   |  | [2]  |  |

(d) Fig. 6.2 shows the next experiment. The teacher places one drop of bromine in 50 cm<sup>3</sup> of water in a beaker. She stirs the mixture to make the bromine dissolve.

For Examiner's Use

She places 10 cm<sup>3</sup> samples of the bromine water in each of three gas-jars. Each gas-jar contains one of the gases ethane, ethene and methane. She shakes the jars. The bromine water in one of the jars loses its colour.

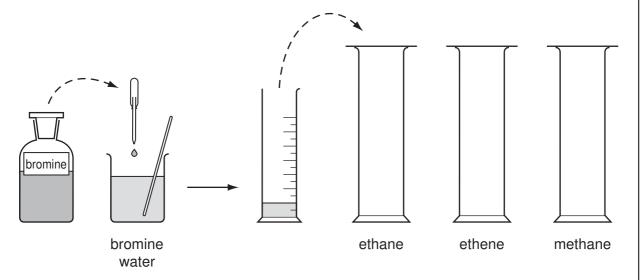

Fig. 6.2

| (i)  | Which gas, ethane, ethene or methane, reacts with the bromine?                   |
|------|--|
|      | [1]  |
| (ii) | What does this show about the structure of the molecules of the gas that reacts? |
|      |  |
|      | [1]  |

**(e)** The teacher gives a student a crystal of iodine in a dry test-tube. She tells her to warm the test-tube using a small flame. Fig. 6.3 shows the student's diagram of the result.
